## Introduction:

This document outlines solution 3 from Deliverable D, followed by the steps and schedules of the group members for the 3 prototypes while including the contingency plans for these schedules, the necessary materials with a budget plan, and testing methodology for prototypes. With the goal of designing glasses for people with visual impairment to test the camera subsystem, object detection subsystem, and location subsystem individually and collectively.

### Risks and Contingency Plans:

1- Lack of time to complete prototypes for teammate responsible:

In the event that the team member responsible for the sketches, design, build or assembly of a prototype does not have the time to complete it, other teammates will help in any way possible to ensure the work is completed on time.

2- Lack of time to complete testing:

If the team member responsible for testing lacks the time to complete, other team members will help like with the completion of the prototypes.

Objective of prototype:

Creating a prototype resembling the actual to receive feedback to receive feedback on general concept idea, design, subsystems and aesthetic or other non-functional requirement.

Stopping criterion:

Once a test has been successful twice in a row, the objective for the specific test can be considered as achieved.

## Conclusion:

After sketching different conceptual designs, project, cost and prototype planning is the next step. This step, being one the most important steps, allows us to visualize what the final product could look like and prepare for designing and building prototypes. We began this step by sketching our final chosen concept. Then, we outlined a schedule for prototyping and testing, followed by an estimate of the cost of the prototypes based on a list of equipment and material. Finally, we outlined a plan for testing our different prototypes.
